Klein, Klaus F Willmes - von Hinckeldey, Karin Kucian, 2015-02-24 Living at the beginning of the 21st century requires being numerate because numerical abilities are not only essential for life prospects of individuals but also for economic interests of post industrial knowledge societies Thus numerical development is at the core of both individual as well as societal interests There is the notion that we are already born with a very basic ability to deal with small numerosities Yet this often called number sense seems to be very restricted approximate and driven by perceptual constraints During our numerical development in formal e g school but also informal contexts e g family street we acquire culturally developed abstract symbol systems to represent exact numerosities in particular number words and Arabic digits refining our numerical capabilities In recent years numerical development has gained increasing research interest documented in a growing number of behavioural neuro scientific educational cross cultural and neuropsychological studies addressing this issue Additionally our understanding of how numerical competencies develop has also benefitted considerably from the advent of different neuro imaging techniques allowing for an evaluation of developmental changes in the human brain In sum we are now starting to put together a more and more coherent picture of how numerical competencies develop and how this development is associated with neural changes as well In the end this knowledge might also lead to a better understanding of the reasons for atypical numerical development which often has grievous consequences for those who suffer from developmental dyscalculia or mathematics learning disabilities Therefore this Research Topic deals with all aspects of numerical development findings from behavioural performance to underlying neural substrates from cross sectional to longitudinal evaluations from healthy to clinical populations To this end we included empirical contributions using different experimental methodologies but also theoretical contributions review articles or opinion papers **Teaching Number** Robert J Wright, Garry Stanger, Ann K

Stafford, James Martland, 2006-08-30 The book lets teachers identify where their students are in terms of number skills and sets out a strategy for developing their knowledge The authors show how to advance children s learning across five stages of early arithmetical learning emergent perceptual figurative initial number and facile number This provides for increasingly sophisticated number strategies across addition subtraction multiplication and division as well as developing children s

number word and numeral knowledge and their ability to structure number and have grouping strategies The approach used nine guiding principles for teaching Each chapter has clearly defined teaching procedures which show how to take the children onto the next more sophisticated stage The teaching procedures are organized into key teaching topics and each includes a clearly defined purpose detailed instructions activities learning tasks and reinforcing games lists of responses which children may make application in whole class small group and individualised settings a link to the Learning Framework in Number see Early Numeracy second edition 2005 how the guiding principles for teaching can be used to allow teachers to evaluate and reflect upon their practice Primary practitioners in Australia the United States the United Kingdom and Canada have tested the teaching procedures which can be used in conjunction with each country s numeracy strategy Primary teachers especially of the early years mathematics co ordinators heads of school mathematics advisers special educationalists learning support personnel teacher assistants lecturers in initial teacher training and educational psychologists will all find this book invaluable
