

Cell Cycle and Cell Division

INTRODUCTION

- Cell division is a very important process in all living organisms.
- All cells reproduce by dividing. Each parental cell gives rise to two daughter cells each time.
- During the life span of a cell, cell division, replication and cell growth take place in a coordinated way to ensure that the progeny cells receive intact genomes.
- All life forms whether unicellular or multicellular start their life with a single cell.
- Hammerling and Boveri have pointed out the role of nucleus in heredity. Strasburger (1873) stated that nuclei arise from pre-existing nuclei. He also explained the process of cell division in plant cells.
- Flemming in 1882 first of all described cell division in animal cells and coined the term 'mitosis' (mitos — divisible).
- Strasburger and Winiwarter in 1900 studied meiosis in rabbits.
- Farmer and Moore in 1905 gave the term 'meiosis' for the cell division in which the number of chromosomes become half, in daughter cells.
- Although DNA synthesis (DNA synthesis) increases (DNA synthesis) during (DNA synthesis) in the cell cycle i.e., synthetic phase.
- The replicated chromosomes are then distributed to daughter nuclei by a complex series of events during cell division. These events are under genetic control.
- The continuity of life mainly depends on cell division.

CELL DIVISION

Division of a parent cell into daughter cells is called cell division.

- **Types of Cell Division:** Cell division is of three types— Amitosis, mitosis and meiosis.

Definition

Cell Division: Formation of daughter cells from the parent cell.
