Analysis of DC Circuits

THEORY

A dc circuit is a circuit in which the voltages of all independent voltage sources and the currents of all independent current sources have constant values. All of the currents and voltages of a dc circuit, including mesh currents and node voltages, have constant values. PSpice can analyze a dc circuit to determine the values of the node voltages and also the values of the currents in voltage sources. PSpice uses the name "Bias Point" to describe this type of analysis. The name "Bias Point" refers to the role of **dc analysis** in the analysis of a transistor amplifier.)

In this lab we consider four examples. The first example illustrates analysis of circuits containing independent sources while the second is dependent sources. The third illustrates the use of PSpice to check the node or mesh equations of a circuit to verify that these equations are correct. The final example uses PSpice to compare two dc circuits.

There is a six-step procedure to organize circuit analysis using PSpice. This procedure is stated as follows:

- Step 1.** Formulate a circuit analysis problem.
- Step 2.** Describe the circuit using Schematics. This description requires three activities.
 - a. Place the circuit elements in the Schematics workspace.
 - b. Adjust the values of the circuit element parameters.
 - c. Wire the circuit to connect the circuit elements and add a ground.
- Step 3.** Simulate the circuit using PSpice.
- Step 4.** Display the results of the simulation, for example, using probe.
- Step 5.** Verify that the simulation results are correct.
- Step 6.** Report the answer to the circuit analysis problem.
