Despeckle Filtering for Ultrasound Imaging and Video, Volume II Christos P. Loizou, Constantinos S. Pattichis, 2022-06-01 In ultrasound imaging and video visual perception is hindered by speckle multiplicative noise that degrades the quality. Noise reduction is therefore essential for improving the visual observation quality or as a pre-processing step for further automated analysis such as image/video segmentation, texture analysis and encoding in ultrasound imaging and video. The goal of the first book (book 1 of 2 books) was to introduce the problem of speckle in ultrasound image and video as well as the theoretical background, algorithmic steps and the Matlab™ for the following group of despeckle filters: linear despeckle filtering, non-linear despeckle filtering, diffusion despeckle filtering and wavelet despeckle filtering. The goal of this book (book 2 of 2 books) is to demonstrate the use of a comparative evaluation framework based on these despeckle filters introduced on book 1 on cardiovascular ultrasound image and video processing and analysis. More specifically, the despeckle filtering evaluation framework is based on texture analysis, image quality evaluation metrics and visual evaluation by experts. This framework is applied in cardiovascular ultrasound image/video processing on the tasks of segmentation and structural measurements, texture analysis for differentiating between two classes (i.e. normal vs. disease) and for efficient encoding for mobile applications. It is shown that despeckle noise reduction improved segmentation and measurement of tissue structure. Investigated, increased the texture feature distance between normal and abnormal tissue, improved image/video quality evaluation and perception and produced significantly lower bitrates in video encoding. Furthermore, in order to facilitate further applications, we have developed in MATLAB™ two different toolboxes that integrate image IDF and video VDF despeckle filtering, texture analysis and image and video quality evaluation metrics. The code for these toolsets is open source and these are available to download complementary to the two monographs.

Despeckle Filtering for Ultrasound Imaging and Video, Volume I Christos P. Loizou, Constantinos S. Pattichis, 2022-05-31 It is well known that speckle is a multiplicative noise that degrades image and video quality and the visual expert's evaluation in ultrasound imaging and video. This necessitates the need for robust despeckling image and video techniques for both routine clinical practice and teleconsultation. The goal for this book (book 1 of 2 books) is to introduce the problem of speckle occurring in ultrasound image and video as well as the theoretical background, equations, the algorithmic steps and the MATLAB™ code for the following group of despeckle filters: linear filtering, nonlinear filtering, anisotropic diffusion filtering and wavelet filtering. This book proposes a comparative evaluation framework of these despeckle filters based on texture analysis, image quality evaluation metrics and visual evaluation by medical experts. Despeckle noise reduction through the application of these filters will

improve the visual observation quality or it may be used as a pre processing step for further automated analysis such as image and video segmentation and texture characterization in ultrasound cardiovascular imaging as well as in bandwidth reduction in ultrasound video transmission for telemedicine applications The aforementioned topics will be covered in detail in the companion book to this one Furthermore in order to facilitate further applications we have developed in MATLAB™ two different toolboxes that integrate image IDF and video VDF despeckle filtering texture analysis and image and video quality evaluation metrics The code for these toolsets is open source and these are available to download complementary to the two books Table of Contents Preface Acknowledgments List of Symbols List of Abbreviations Introduction to Speckle Noise in Ultrasound Imaging and Video Basics of Evaluation Methodology Linear Despeckle Filtering Nonlinear Despeckle Filtering Diffusion Despeckle Filtering Wavelet Despeckle Filtering Evaluation of Despeckle Filtering Summary and Future Directions References Authors Biographies

Algorithms and Software for Predictive and Perceptual Modeling of Speech Venkatraman Atti, 2022-05-31

From the early pulse code modulation based coders to some of the recent multi rate wideband speech coding standards the area of speech coding made several significant strides with an objective to attain high quality of speech at the lowest possible bit rate This book presents some of the recent advances in linear prediction LP based speech analysis that employ perceptual models for narrow and wide band speech coding The LP analysis synthesis framework has been successful for speech coding because it fits well the source system paradigm for speech synthesis Limitations associated with the conventional LP have been studied extensively and several extensions to LP based analysis synthesis have been proposed e g the discrete all pole modeling the perceptual LP the warped LP the LP with modified filter structures the IIR based pure LP all pole modeling using the weighted sum of LSP polynomials the LP for low frequency emphasis and the cascade form LP These extensions can be classified as algorithms that either attempt to improve the LP spectral envelope fitting performance or embed perceptual models in the LP The first half of the book reviews some of the recent developments in predictive modeling of speech with the help of Matlab™ Simulation examples Advantages of integrating perceptual models in low bit rate speech coding depend on the accuracy of these models to mimic the human performance and more importantly on the achievable coding gains and computational overhead associated with these physiological models Methods that exploit the masking properties of the human ear in speech coding standards even today are largely based on concepts introduced by Schroeder and Atal in 1979 For example a simple approach employed in speech coding standards is to use a perceptual weighting filter to shape the quantization noise according to the masking properties of the human ear The second half of the book reviews some of the recent developments in perceptual modeling of speech e g masking threshold psychoacoustic models auditory excitation pattern and loudness with the help of Matlab™ simulations Supplementary material including Matlab™
