Electronic TSM Transistorized Anniversary Clock

This clock marked the transition from spring driven and solenoid driven mechanical movements to transistorized movements. Until then pendulums had been powered by mechanisms. This model uses a battery system beneath the base to swing the pendulum, and the fork near the suspension moves the pivot arm from side to side. This action rotates the gears in the clock which turn the hands. Unlike later quartz clocks, the pendulum length still controls the timekeeping.

The repair of these clocks requires two quite different skills. The movement is of conventional design, needing conventional clockmaking skills to service and repair. The electronic device beneath the base requires knowledge of basic electronics and soldering, and this document will address the latter in the hope that it will assist clockmakers.

In order to identify if a problem lies with the mechanism or the module, first remove the suspension and replace it with the fork pointing to the rear. This will eliminate mechanical problems, with the exception of the suspension unit. The battery in this clock is large but the force of each pulse is fairly weak. The pendulum must hang in the printed circle on the base when stopped, and the suspension block at the top must be adjusted to ensure the clock is in beat. Just like any mechanical clock, if it is not in beat it will stop.

If everything mechanical has been adjusted correctly and the clock fails to run, check the battery. Modern 1.5v cells have a smaller positive cap at the top and these do not locate well in the original holder. Make sure both contacts are clean and that the battery is making contact with the holder terminals before assuming that an electronic fault exists. A multimeter should be used to check the voltage on the battery holder connectors.

The two most common faults are with the coils and with the transistor. To identify the cause of the fault, you will need to remove the base, and remove the plastic housing containing the coils etc. The cardboard gasket is vital, as it acts as an insulation between the wiring and the brass body, which is grounded.

Identifying the fault

To properly identify the fault you will need to desolder some connections and test the individual components with a test meter. The transistor is vulnerable to heat damage, so always use a heat sink on the leads.

Transistors can be tested with a test meter.

- Base to emitter is like a diode and should conduct in only one direction
- Base to collector is like a diode and should conduct in only one direction
- Collector to emitter should not conduct in either direction.

Most suitable PNP transistors will have this case layout.

The original transistors were of this style.

B = Base C = Collector E = Emitter
