Abstract

In the present paper we have used the Differential forms also known as exterior calculus of E.Cartan [1922] in Pullback calculations and proving the main theorems of advanced calculus i.e. Green, Gauss and Stoke's theorems. In particular a convenient test for a transformation to be canonical is given with examples based on differential forms, which is more suitable than tests given by Goldstein et.al.[2004].

Keywords: Differential form, canonical transformation, exterior derivative, wedge product

(1) Introduction

The calculus of differential forms, developed by E.Cartan [1922], is one of the most useful and fruitful analytic techniques in differential geometry. The catalogue of concepts that are unified and simplified by forms is astonishing : divergence and curl of three-dimensional Euclidean geometry, Green's theorem, Stoke's theorem and Gauss's theorem, the theory of integration on manifolds and much more. In this paper we have proved the Green, Gauss and Stokes' theorems using differential form.

Since, a system can be described by more than one set of generalized coordinates, say for the motion of a particle in a plane, we may use as generalized coordinates either the cartesian coordinates (x, y) or the plane polar coordinates (r, θ) . Both choices are equally valid, but one out of these two sets may be convenient for the problem under consideration. A convenient choice of coordinates for the problem under consideration, is the set of those generalized coordinates which are *cyclic*. It

Differential Forms and Applications Manfredo P. Do Carmo, 2012-12-06 This is a free translation of a set of notes published originally in Portuguese in 1971 They were translated for a course in the College of Differential Geometry ICTP Trieste 1989 In the English translation we omitted a chapter on the Frobenius theorem and an appendix on the nonexistence of a complete hyperbolic plane in euclidean 3 space Hilbert's theorem For the present edition we introduced a chapter on line integrals In Chapter 1 we introduce the differential forms in $\mathbb{R}^n$ We only assume an elementary knowledge of calculus and the chapter can be used as a basis for a course on differential forms for users of Mathematics In Chapter 2 we start integrating differential forms of degree one along curves in $\mathbb{R}^n$ This already allows some applications of the ideas of Chapter 1 This material is not used in the rest of the book In Chapter 3 we present the basic notions of differentiable manifolds It is useful but not essential that the reader be familiar with the notion of a regular surface in $\mathbb{R}^3$ In Chapter 4 we introduce the notion of manifold with boundary and prove Stokes theorem and Poincaré's lemma Starting from this basic material we could follow any of the possible routes for applications Topology Differential Geometry Mechanics Lie Groups etc We have chosen Differential Geometry For simplicity we restricted ourselves to surfaces
