Shadows Of The Circle: From Conic Sections To Planetary Motion (Second Edition) Vagn Lundsgaard

Hansen,2024-06-04 The ancient Greeks were the first to seriously ask for scientific explanations of the panorama of the heavens based on mathematical ideas Ever since mathematics has played a major role for human perception and description of the outside physical world and in a larger perspective for comprehending the universe This second edition pays tribute to this line of thought and takes the reader on a journey in the mathematical universe from conic sections to mathematical modelling of planetary systems In the second edition the four chapters in the first edition on conic sections two chapters isoperimetric problems for plane figures and non Euclidean geometry are treated in four revised chapters with many new exercises added In three new chapters the reader is taken through mathematics in curves mathematics in a Nautilus shell and mathematics in the panorama of the heavens In all chapters of the book the circle plays a prominent role This book is addressed to undergraduate and graduate students as well as researchers interested in the geometry of conic sections including the historical background and mathematical methods used It features selected important results and proofs that not only proves but also explains the results

Shadows Of The Circle: Conic Sections, Optimal Figures And Non-euclidean Geometry Vagn Lundsgaard Hansen,1998-04-04 The aim of this book is to throw light on various facets of geometry through development of four geometrical themes The first theme is about the ellipse the shape of the shadow cast by a circle The next a natural continuation of the first is a study of all three types of conic sections the ellipse the parabola and the hyperbola The third theme is about certain properties of geometrical figures related to the problem of finding the largest area that can be enclosed by a curve of given length This problem is called the isoperimetric problem In itself this topic contains motivation for major parts of the curriculum in mathematics at college level and sets the stage for more advanced mathematical subjects such as functions of several variables and the calculus of variations The emergence of non Euclidean geometries in the beginning of the nineteenth century represents one of the dramatic episodes in the history of mathematics In the last theme the non Euclidean geometry in the Poincaré disc model of the hyperbolic plane is developed
