**Computational Contact and Impact Mechanics** Tod A. Laursen, 2003-05-12 Many physical systems require the description of mechanical interaction across interfaces if they are to be successfully analyzed Examples in the engineered world range from the design of prosthetics in biomedical engineering e g hip replacements to characterization of the response and durability of head disk interfaces in computer magnetic storage devices to development of pneumatic tires with better handling characteristics and increased longevity in automotive engineering to description of the adhesion and or relative slip between concrete and reinforcing steel in structural engineering Such mechanical interactions often called contact impact interactions usually necessitate at minimum the determination of areas over which compressive pressures must act to prevent interpenetration of the mechanical entities involved Depending on the application frictional behavior transient interaction of interfaces with their surroundings e g in intermittent stick slip thermo mechanical coupling interaction with an intervening lubricant and or fluid layer and damage of the interface i e wear may also be featured When taken together or even separately these features have the effect of making the equations of mechanical evolution not only highly nonlinear but highly nonsmooth as well While many modern engineering simulation packages possess impressive capabilities in the general area of nonlinear mechanics it can be contended that methodologies typically utilized for contact interactions are relatively immature in comparison to other components of a nonlinear finite element package such as large deformation kinematics inelastic material modeling nonlinear equation solving or linear solver technology
